Revision Log:

Revision No.	Date	Description of Changes	Author	Reviewed	Approved
1	11/11/2020	Added Miocene Canal alternative. Added growth projection.	Jenny Skrel, John Buttz	Marc Mattox	

1. Introduction

The Town of Paradise (Town) is implementing the Paradise Sewer Project (Project), which involves identifying and implementing a long-term solution for collection, treatment, and reuse/disposal of its wastewater. HDR is under contract to assist the Town with the first two phases of the Project—final selection of a wastewater alternative (Phase 1), and preparation of an Environmental Impact Report (EIR) covering the selected alternative (Phase 2). This technical memorandum (TM) is part of the Phase 1 effort.

The goal of this TM #2 is to define the projected population growth and accompanying wastewater flows and loads to properly develop and evaluate local treatment and disposal alternatives for Paradise.

The purpose of this TM #2 is to provide an overview of regulatory requirements and to establish design criteria and basis of design for a new wastewater treatment plant (WWTP) that will be owned and operated by the Town. Projected flows and loads from the proposed sewer service area (SSA) shown in Figure 1 will be used to establish the design criteria and basis of design.

This TM is organized as follows:

- Section 1: Introduction
- Section 2: Background
- Section 3: Regulatory Requirements
- Section 4: Planning Considerations

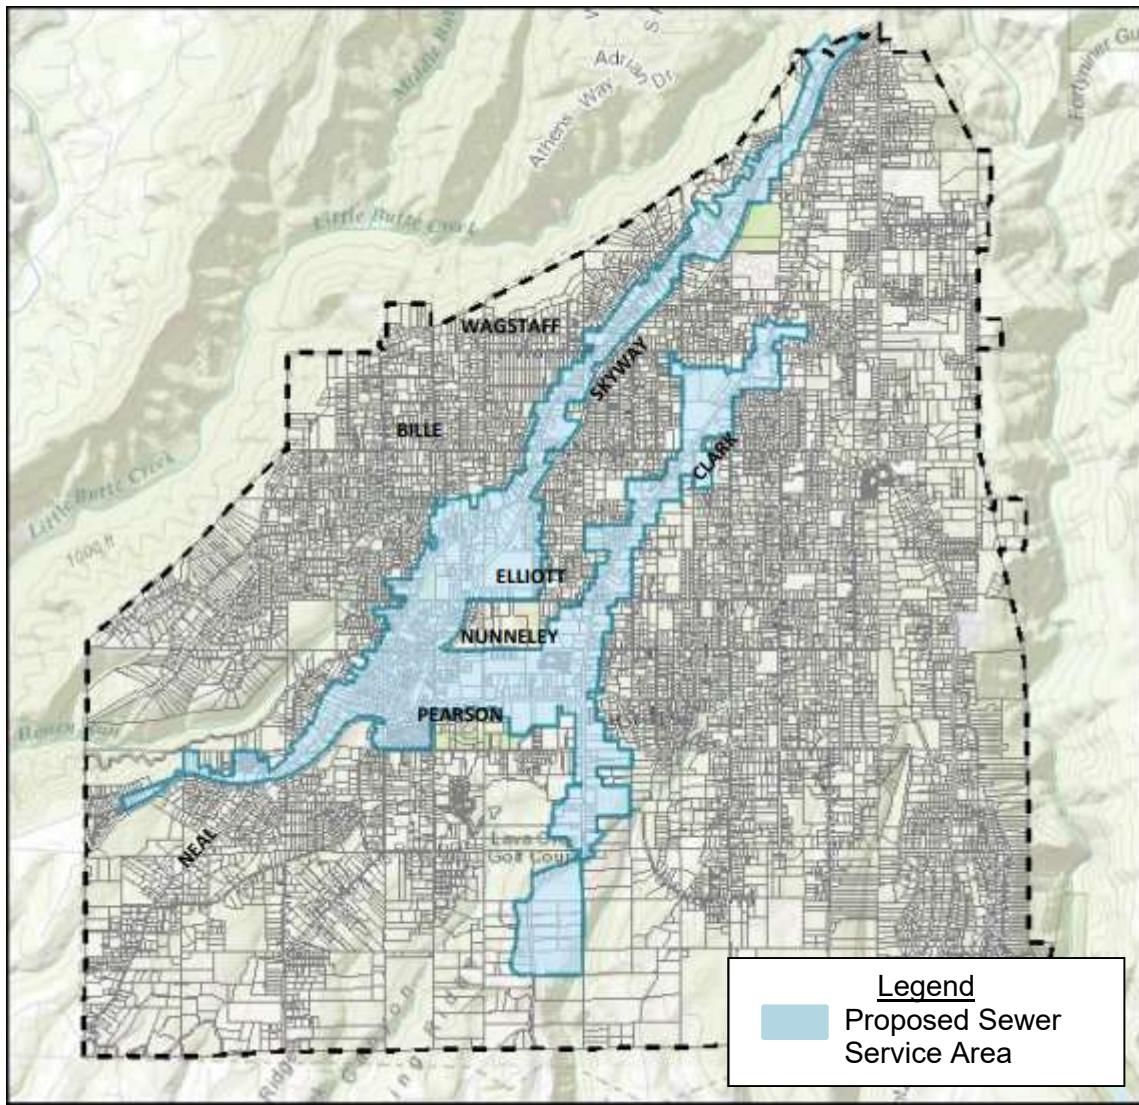

Figure 1. Proposed Town of Paradise Sewer Service Area

2. Background

Prior to the Camp Fire, Paradise was the largest unsewered community in California. A new wastewater management solution is needed to improve the local economy (e.g., encourage opening of new businesses) and to stop degradation of groundwater quality caused by failed or failing septic systems.

The need for a centralized wastewater treatment solution for Paradise has been studied in seven prior reports. The most recent study was prepared by Bennett Engineering in June 2017, *Town of Paradise Sewer Project, Alternative Analysis and Feasibility Report: Determining a Preferred Option for Implementation* (2017 Report). Figure 1 presents the proposed SSA identified in the 2017 Report; the Town has directed that this will be the proposed SSA for this effort. A new collection system will be constructed in the proposed SSA to convey wastewater collected in the area to a new local WWTP. Based on the 2017 Report, the proposed SSA was defined to represent the area that had

the most septic systems that had failed or were projected to fail within the next 5 years. The proposed SSA will serve 1,469 parcels through the Skyway, Clark Road, and Pearson Road corridors. (There are 11,000 total parcels in Paradise.) The 2017 Report analyzed the following five WWTP alternatives:

- Option A: Localized WWTP with Effluent Land Application
- Option B: Localized WWTP with Surface Water Discharge Location
- Option C: Regional Connection to the City of Chico Water Pollution Control Plant
- Option D: Wastewater Treatment with Beneficial Reuse
- Option E: No Project

The 2017 Report also analyzed two sewer collection system alternatives: a gravity sewer and a septic tank effluent pumping (STEP) system.

For the WWTP, the 2017 Report recommended Option C: Regional Connection to the City of Chico Water Pollution Control Plant. For the collection system, the 2017 Report recommended the STEP system.

Following the devastation caused by the November 2018 Camp Fire, the Town reconsidered the recommendations from the 2017 Report. In May 2019, the Town Council voted to pursue a localized wastewater treatment alternative for the following reasons:

- More funding opportunities became available since the 2017 Report was issued.
- More land became available to locate a local WWTP due to the devastation caused by the Camp Fire.
- The Town would have more control over future decisions related to wastewater management.
- The political climate within the City of Chico could delay the wastewater management project under Option C, which included connection to the City of Chico.

The type of collection system was also reconsidered. The 2017 Report recommended a STEP system, but the Town recently determined that a conventional gravity sewer system is the preferred collection system alternative. A gravity sewer was preferred because it eliminated continued use of the septic tanks and installation of new individual pumps that each parcel owner would need to maintain.

3. Regulatory Requirements

3.1 Effluent Discharge Requirements

A number of options are available for managing treated plant effluent. Each effluent management option will have unique effluent quality requirements. These requirements are directed toward the protection of public health, water quality, fish, wildlife, and vegetation. The Central Valley Regional Water Quality Control Board (Regional Board) has the primary authority for setting waste discharge requirements for the Town.

The local wastewater effluent disposal alternatives that are being studied as part of this TM are as follows:

- Alternative 1: Local WWTP with Effluent Storage and Land Application
- Alternative 2: Local WWTP with a Surface Water Discharge
- Alternative 3: Local WWTP with Beneficial Reuse within the Town
- Alternative 4: Local WWTP with Discharge to the Miocene Canal

Since completion of the 2017 Report, discharge to the Miocene Canal has been added as a potential local disposal alternative. It is anticipated that the Regional Board will designate discharge to the Miocene Canal as an indirect potable reuse project because seepage from the canal may recharge adjacent shallow domestic groundwater wells and the tailwater from the canal enters a water body with a municipal use designation.

Anticipated discharge requirements for the above-listed alternatives are provided in Table 1.

Table 1. Anticipated Discharge Requirements for Local Treated Effluent Discharge Alternatives

Disposal Method	Basic Discharge Requirements (monthly average)			Level of Treatment
	BOD, mg/L	TSS, mg/L	Total N, mg/L	
1. Local WWTP with Effluent Storage and Land Application	30	30	10	Disinfected (23 MPN) secondary treatment meeting Total N of 10 mg/L.
2. Local WWTP with Surface Water Discharge	10	10	10	Disinfected (2.2 MPN) tertiary treatment meeting Total N of 10 mg/L. Additional stringent discharge requirements are likely, such as meeting priority pollutant (chemical pollutants the EPA regulates) criteria as well as the California Thermal Plan (limit wastewater increasing receiving water temperature).
3. Local WWTP with Beneficial Reuse within the Town	10	10	10	Disinfected (2.2 MPN) tertiary treatment meeting Total N of 10 mg/L.
4. Local WWTP with Discharge to the Miocene Canal	10	10	10	Disinfected (2.2 MPN) tertiary treatment meeting Total N of 10 mg/L. Additional advanced treatment requirements must be met, including, as a minimum, processes to meet indirect potable reuse requirements such as ultrafiltration along with reverse osmosis.

BOD = biochemical oxygen demand; EPA = US Environmental Protection Agency; MPN = most probable number; N = nitrogen
TSS = total suspended solids

3.2 Biosolids Management

Regulations regarding the end use and disposal of biosolids have been promulgated on a national level by the US Environmental Protection Agency (EPA) through 40 Code of Federal Regulations (CFR) Part 501, State Sludge Management Program Regulations (May 2, 1989) and 40 CFR Part 503, Standards for the Use of Disposal of Sewage Sludge (February 19, 1993). The 40 CFR Part 501 regulations focus on administrative rules for permitting of biosolids management programs,

while the 40 CFR Part 503 regulations present technical requirements for biosolids use and selected disposal operations.

In California, smaller wastewater agencies typically dispose of biosolids onto land or convey it to a landfill for use as alternative daily cover. However, biosolids management has recently become increasingly challenging and complex, especially for smaller agencies. The biosolids challenges that lie ahead are due to California regulations mandating reductions in greenhouse gas emissions as well as emerging contaminants. To meet these regulations, more aggressive greenhouse gas emission reduction goals targeting diversion of organics from landfills are likely.

The biosolids credit as alternative daily cover will be discontinued in 2020. It is anticipated that by 2025, landfills may no longer accept biosolids for disposal. Until recently, it was observed that biosolids land application was becoming more restrictive. More than 80 jurisdictions in California are restricting biosolids beneficial reuse in some capacity, and some jurisdictions are banning biosolids application all together, as Kern County tried to do, or are restricting application to only Class A biosolids (discussed in the following paragraphs). To some extent, Senate Bill 1383 may be changing the nature of land application as it takes away jurisdictional regulation, including prohibition, in an effort to create more alternatives to landfill disposal.

The 40 CFR Part 503 regulations identify two classes of sludge, Class A and Class B, which are distinguished based on biosolids quality, and vector and pathogen reduction requirements:

- **Class A:** For biosolids to be classified as Class A, pathogens must be reduced to virtually non-detectable levels, and the material must also comply with strict standards regarding metals, odors, and vector attraction reduction as specified in the 40 CFR Part 503 regulations. Class A biosolids can be produced by such methods as composting, lime pasteurization, or heat drying. Class A biosolids can be land applied year-round and can be legally used as fertilizer on farms and vegetable gardens, as well as sold to home gardeners as compost or fertilizer.
- **Class B:** Class B biosolids are treated but contain higher levels of detectable pathogens than Class A biosolids. Class B biosolids can be land applied during the dry weather season and can be used as alternative daily cover at landfills.

Because of concerns over pathogens, odors, and future regulations, there is a distinct shift away from Class B use and toward Class A treatment solutions. To provide flexibility in biosolids disposal, it is recommended that biosolids generated from a proposed local WWTP for the Town meet Class A criteria.

4. Planning Considerations

A local WWTP must meet the regulatory requirements noted in Section 3. The plant must also be sized to handle influent flows and loads from Paradise. The design criteria, as well as influent flows and loads, are established in the following sections.

4.1 Projected Wastewater Flows

Determining wastewater flow rates and constituent mass loadings is a fundamental step in initiating the conceptual process design for a new WWTP. Projecting wastewater flows for the proposed SSA is essential for determining the hydraulic characteristics, sizing, and operational considerations for the treatment system components. The projected flows and loads also determine the phasing and fiscal planning for the Town. The constituent mass loading rate is necessary to determine the capacity and operational characteristics of the treatment facilities and ancillary equipment to ensure that treatment objectives are met.

Projecting the SSA flows for Paradise is complicated by the fact that many of the parcels within the SSA are not yet developed, and the type of use that will occur on the parcels is not yet known. When rebuilding a community, historical data are typically used to predict the future growth and loads to be accommodated. Projecting future flows and loads is a balancing act; one needs to make sure flows are not overestimated, causing increased project costs and oversized facilities, while at the same time making sure that flows are not underestimated, resulting in the proposed SSA not being able to be fully served.

The 2017 Report estimated wastewater flow from the proposed SSA based on values listed in Table 2. Using these values, an estimated average dry weather flow (ADWF) of 0.862 million gallons per day (mgd) was determined. The associated peak wet weather flow (PWWF) was estimated as 1.86 mgd.

Table 2. 2017 Report Assumed Flow Values

Description	Value
Single family home	230 gallons per EDU per day
Multi-family home	110 gallons per EDU per day
Non-residential land use	600 gallons per acre per day

EDU = equivalent dwelling unit

Another method to estimate wastewater flow is to review water use records. Water supplied to a parcel can be used inside the house (and result in wastewater) and for landscape irrigation. Water use records in mid-winter, when landscape irrigation is likely near zero, can approximate ADWF generation. The water purveyor for Paradise is the Paradise Irrigation District (PID). PID provided water use records for February 2017 for most of the parcels within the proposed SSA. February 2017 records were used because this was before the Camp Fire (thus representing future water use), and assumed water use would not include water used for irrigation.

Table 3 presents wastewater flow for the proposed SSA based on available PID potable water use data for February 2017.

Table 3. Estimated Wastewater Flow Based on PID Data

Description	Total Number of Parcels in Proposed SSA	Acres	PID Water Use for Parcels with Water Use Data (gals/day)	Flow per Acre (gals/acre)	Recommended ADWF for All Parcels within Proposed SSA (gals/day)	
	Total Acres	Acres with PID Water Use Data				
Agricultural Residential	10	22.42	22.42	1,571	70.1	1,571
Central Commercial	197	60.17	45.2	24,347	538.7	32,397
Community Service	77	128.27	86.36	25,934	300.3	38,520
Light Industrial	25	105.6	65.37	6,887	105	11,122
Multi-Family Residential	234	202.31	140.33	97,266	693	140,236
Neighborhood Commercial	9	5.25	4.0	1,086	272	1,425
Public Institution	23	75.37	65.85	7,085	108	8,187
Recreational	5	13.37	13.37	-	0	0
Rural Residential	21	23.85	20.21	4,098	203	4,836
Town Commercial	486	409.15	306.08	115,322	377	154,058
Town Residential	382	167.86	137.0	45,067	329	55,206
TOTAL	1,469		328,663			447,559

For parcels with available PID records, water use in February 2017 was 329,000 gallons per day. To determine the recommended ADWF, water use per acre was determined, and this value was applied to parcels with no water use data. This value was then added to the known water use provided by PID to determine the recommended ADWF of 448,000 gallons per day. The flow of 448,000 gallons per day is approximately half the flow estimated in the 2017 Report (861,000 gallons per day). This difference is in part due to extensive water conservation in California in reaction to the drought. Per capita flow values at WWTPs across the state are continuing to decrease.

In addition to determining an ADWF rate, both a peak diurnal flow rate and PWWF rate need to be determined to size both the WWTP and conveyance facilities.

For a new WWTP, where infiltration and inflow into a new collection system are considered to be low, a ratio of 1:1.5 for ADWF to peak diurnal flow and a ratio of 1:2.0 for ADWF to PWWF are typical. Using these two factors, Table 4 presents the recommended wastewater design flows (without septage).

Table 4. Recommended Wastewater Design Flows Without Septage

Flow Type	Flow without Septage, mgd
ADWF	0.448
Peak Diurnal Flow	0.672
PWWF	0.896

In this TM, Appendix A provides wastewater generation for each parcel in the proposed SSA for the three methods of estimation: 2017 Report, PID water use, and final recommendation.

4.2 Projected Septage Flows

A significant portion of Paradise, the area shown in Figure 1 outside of the delineated SSA but within the town limits, will remain on septic tanks. There are 9,531 parcels in this unsewered area (11,000 parcels – 1,469 parcels in the SSA). Septage from the entire town is currently hauled to one of the following two locations:

- A receiving station at the Neal Road Recycling and Waste Facility, a landfill just south of Paradise. From there, a single company (Thrifty Rooter) hauls the septage to Thrifty Rooter's septage treatment facility near Lincoln, California.
- NorCal Environmental Solutions, a facility in Orland, California, 35 miles west of Paradise.

These septage solutions are costly to the citizens of Paradise, and Town staff requested an analysis of treating septage at the potential local WWTP.

A number of septage haulers and the two disposal facilities were contacted. Only one hauler, Hegenbart Septic Tank Hauling, provided information. Hegenbart Septic Tank Hauling estimates, pre-fire, that they serviced 25 percent of Paradise and hauled two to three tank loads per day, 5 days per week. Each load is 3,000 gallons. Based on this information, an estimated 30,000 gallons of septage per weekday would be hauled to a new local WWTP.

Another method to determine septage flow is to look at the parcels in Paradise that will remain on septic (9,531 parcels). Assuming that each septic tank contains 3,000 gallons when full and that each tank is pumped out once every 5 years results in a flow of 15,700 gallons per day of septage that would be hauled to a new local WWTP. Assuming that septage is hauled 5 days per week, this equates to 22,000 gallons per weekday.

Taking the average of both methods results in an estimated 26,000 gallons of septage hauled to a local WWTP each weekday.

4.3 Wastewater Pollutant Load

The 2017 Report recommended a STEP collection system. STEP effluent is less concentrated than conventional gravity sewer effluent because of the settling of solid particles in the septic tank. Because this analysis assumes gravity sewers and no septic tanks, the concentrations of constituents in the wastewater must be re-estimated. In addition, concentrations for septage need to be established.

4.3.1 Municipal Wastewater Constituents

The first method used to estimate municipal wastewater constituents was to use figures from a recognized industry-standard textbook (*Design of Municipal Wastewater Treatment Plants: WEF Manual of Practice No. 8*, 2010). This textbook estimates biochemical oxygen demand (BOD), total suspended solids (TSS), and ammonia concentrations for typical untreated wastewater at 350 mg/L, 400 mg/L, and 45 mg/L, respectively (assuming a high-strength wastewater with lower amounts of dilution water, estimated at 60 gallons per capita per day wastewater generation).

The second method used to estimate municipal wastewater constituents was comparing actual wastewater flows from similar-sized municipalities. Influent wastewater data were reviewed from five cities: Chico, Ione, Jackson, Nevada City, and Placerville. Chico was selected because it is a neighboring community where many residents of Paradise moved after the Camp Fire, which resulted in increased flows to the Chico Water Pollution Control Plant of about 0.5 mgd. Ione, Jackson, Nevada City, and Placerville were selected because they have smaller WWTPs comparable in size to that proposed for Paradise. Table 5 presents BOD and TSS data from these plants. No influent ammonia data were available from these plants.

Table 5. Municipal Wastewater Concentrations from Various WWTPs

City	Flow, mgd (1)		BOD, mg/L (1)		TSS, mg/L (1)		Comments
	ADWF	Annual Average	Annual Average	Max Month	Annual Average	Max Month	
Chico	6.51	7.12	237	315	245	298	
Ione	0.55	NA	292	NA	267	NA	
Jackson	0.564	0.624	266	356	351	880	Collection system issue in wet weather
Nevada City	0.476	0.535	275	381	252	373	
Placerville	0.905	1.114	404	595	438	809	Service area includes a brewery and jail

(1) Data are for year 2019 except for Ione; Ione data are for year 2012.

NA = data not available

The data in Table 5 varied but provided valuable information in setting the design concentrations for Paradise. Based on Metcalf and Eddy, and review of other WWTP data, the recommended design concentrations for BOD, TSS, and ammonia are presented in Table 6.

Table 6. Recommended Municipal Wastewater BOD, TSS, and Ammonia Design Concentrations

Constituent	Concentration, mg/L
Biochemical Oxygen Demand (BOD)	350
Total Suspended Solids (TSS)	400
Ammonia (as Nitrogen)	45

4.3.2 Septage Pollutant Load

Pollutant concentrations for septage were estimated using two methods: information from an existing septage receiving station (Union Mine Landfill in El Dorado County, California; *Union Mine Landfill Predesign Report*, dated 1993) and from an EPA handbook (*Guide to Septage Treatment and Disposal*, EPA/625/R-94/002, dated 1994). Based on these two sources, a recommended assumption for septage constituent concentrations was derived (see Table 7).

Table 7. Recommended Septage BOD, TSS, and Nitrogen Design Concentrations

Constituent	Concentration, mg/L		
	Union Mine Landfill (1)	EPA Handbook (2)	Recommended
Biochemical Oxygen Demand (BOD)	10,000	400 to 78,600	10,000
Total Suspended Solids (TSS)	40,000	310 to 93,378	40,000
Total Kjeldahl Nitrogen (TKN)	700	66 to 1,060	700

(1) *Union Mine Landfill Predesign Report*, October 1993, prepared by HDR. Septage data in this report came from the Sacramento Regional Wastewater Treatment Plant.

(2) *Guide to Septage Treatment and Disposal*, EPA/625/R-94/002, 1994.

Based on the data in Table 7, if septage from within the Paradise town limits was brought to a new local WWTP, it would be a major contributor to WWTP loads. The septage is also a very different liquid stream than municipal wastewater, lending itself to very different treatment methods.

Combining septage with municipal wastewater for treatment in a single treatment train would likely result in a larger and more expensive facility. To minimize these costs, it is recommended that if septage is received at a new local WWTP, a separate septage treatment train be included in the design.

The current cost for disposal of septage is costly for Paradise citizens. Citizens pay local haulers \$0.32 per gallon of septage hauled away, which equates to \$960 every 5 years. Collectively that amounts to \$1.8 million per year. Town staff has indicated that accepting septage originating from outside of the Paradise town limits might also be considered if a new local WWTP had septage treatment included. This could become a revenue source for the Town. Whether to include septage treatment at a new local WWTP will be analyzed in a future TM.

4.4 Summary of Recommended Flows and Loads

The recommended influent flows and loads for a proposed new local WWTP and separate septage treatment facility are presented in Table 8. For the conventional WWTP, a peaking factor of 1.3 was applied to the average load to estimate the maximum month load.

Table 8. Recommended WWTP and Septage Flows and Loads

Flow Type	Flow to WWTP, mgd		Flow to Septage Treatment, mgd	
ADWF	0.448		0.026	
Peak Diurnal Flow	0.672		--	
PWWF	0.896		--	
Constituent	Annual Average Constituent Load, lbs/day	Maximum Month Constituent Load, lbs/day (1)	Concentration, mg/L	Annual Average Constituent Load (2) lbs/day
Biochemical Oxygen Demand (BOD)	1,310	1,700	10,000	2,170
Total Suspended Solids (TSS)	1,500	1,950	40,000	8,675
Ammonia as Nitrogen	170	220	NA	NA
Total Kjeldahl Nitrogen (TKN)	NA	NA	700	152

(1) Based on flow of 0.448 mgd and peaking factor of 1.3

(2) Based on flow of 0.026 mgd

NA = not applicable

4.5 Projection of Connections and Flows

The discussion in Sections 4.1 through 4.4 developed an estimated ultimate flow from the SSA of 0.448 mgd (ADWF). A projection was then made of how the connections and flows would develop over time, from initial connection of the system to ultimate build-out. At the request of Town staff, a parallel estimate was also made of Paradise parcels occupied over time outside the SSA. The following assumptions were used to develop the projections:

- A total of 300 of 1,466 parcels in the SSA are occupied in 2020 (based on CAL FIRE count of standing dwellings, from the Chico State Geographical Information Center).
- A total of 2,201 of 11,500 parcels in Paradise have standing dwellings, or 1,901 parcels outside the SSA (from the Chico State Geographical Information Center).
- The wastewater system is constructed and comes on-line in 2027.
- The annual growth rate of connections within the SSA is 2.5 percent from 2020 until 2027 (when the wastewater system comes on-line), and 5.0 percent after that. It was felt that having the wastewater system in place would increase the rate of connections within the SSA.
- The annual growth rate outside of the SSA is 6.0 percent from 2020 until 2024, and 4.5 percent after that. This estimate was provided by Town staff.

The resulting projections are presented in Table 9. As shown, build-out within the SSA is projected to occur by 2056.

Table 9. Estimate of Connections and Flows Over Time

Year	Within Sewer Service Area (SSA)			Outside SSA		Total Town Number of Parcels Connected/ Occupied	Notes
	Annual Increase (%)	Average Dry Weather Flow (gal/day)	Number of Parcels Connected	Annual Increase (%)	Number of Parcels Occupied		
2020		91,491	300		1,901	2,201	
2021	2.5	93,778	308	6.0	2,015	2,323	
2022	2.5	96,123	315	6.0	2,136	2,451	
2023	2.5	98,526	323	6.0	2,264	2,587	
2024	2.5	100,989	331	6.0	2,400	2,731	
2025	2.5	103,513	339	4.5	2,508	2,847
